

NETWORK SECURITY

Palo Alto Networks NGFW

Plan application-aware network controls for your offices, data centres and cloud environments.

UNDERSTAND THE PRODUCT

Palo Alto Networks next-generation firewalls provide application-aware network control. App-ID identifies applications rather than relying only on ports; User-ID adds user context. Hardware and software firewall options address different deployment environments. [1, 2]

1

Application visibility

App-ID uses multiple identification techniques to classify network applications, including applications using evasive techniques. This supports application-based access policies. [2]

2

User-aware policy

User-ID adds identity context to application visibility. Teams can use that context when defining permitted access; identity integration must be configured. [2]

3

Traffic insight

The Application Command Center provides a graphical view of application, URL, threat and data traffic. Confirm the services and logging required for your design. [2]

PLATFORM AND PURCHASE CONSIDERATIONS

Choose the hardware or software form factor for the site or cloud environment. Size for traffic with intended inspection enabled, growth and high availability. Confirm security subscriptions, management, logging and support in the proposal.

HOW IT WORKS - SIMPLIFIED

Traffic reaches the firewall; App-ID classifies the application; configured identity context and policy determine access. Logs and application views support review. Encrypted inspection depends on the deployment and decryption configuration. [2]

Capabilities depend on configuration and licensing. Official sources on page 2.

YOUR ITSIPL PURCHASE DISCUSSION

From product to solution.

Define the right product, budget and delivery responsibilities with ITSIPL.

01 Requirements and sizing

Discuss site topology, traffic, internet links, applications, inspection needs and availability targets with ITSIPL.

02 Licensing and quotation

Request the model/form factor, security subscriptions, management, logging, support and high-availability components separately.

03 Migration planning

Ask about policy review, configuration, change windows, testing and rollback. Confirm implementation and acceptance responsibilities.

04 Operations and renewals

Agree configuration ownership, support escalation, subscription renewals and maintenance arrangements in the delivery scope.

BUDGET DRIVERS

Appliance or software choice, inspected throughput, high-availability design, security subscriptions, management/logging, support and migration scope. Request an itemised quote separating licences, one-time work and recurring services.

VALIDATE BEFORE ROLLOUT

Validate business-application access, inspection performance, logging, failover where required, policy administration and rollback readiness.

CLEAR RESPONSIBILITIES, NO SURPRISES

Use your ITSIPL proposal to document licences, services, delivery owner (ITSIPL, vendor or another provider), acceptance criteria and support terms. The discussion areas above are not a promise that every service is included. Confirm your final scope before ordering.

Let's discuss your requirements.
